

ORI · All Recent Runs: Question Scoring & Cause Report

This update replaces “failed” as a model-facing label with scored coverage and reason-specific outcome notes. Raw ORI status remains available in the machine-readable `analysis.json`.

Scope: seven recent report-ready roots (Sept 28–Oct 3); 114 aggregate model/track/repetition rows; 5700 scheduled slots; 3635 attempted. This sum is a workload/coverage inventory across repetitions, not an accuracy denominator.

What the counts mean

- **Right** = ORI-scored correct questions. **Wrong** = ORI-scored incorrect questions. **Scored** = right + wrong (ORI graded).
- **Unscored** = scheduled – scored. The cause column uses public question-result outcome codes where available; if it says “cause not established”, the public aggregates don’t attribute those questions more specifically.
- Attempt/error tallies are listed separately because they may count retries/events and can exceed distinct unscored questions.
- Direct and MCP stay separate. The 21 cross-root comparison gates did not pass; no cross-run leaderboard or causal claim is made.

Row-level ledger

Reason-specific label counts

- All scheduled scored: 1 result slots
- Missing/interrupted · unscored: 34 result slots
- Output-validation issue · unscored: 35 result slots

- Provider/infra issue · unscored: 32 result slots
- Scores recorded · teardown note: 2 result slots
- Timeout-affected · unscored: 9 result slots
- Unscored · cause not established: 1 result slots

Qwen3.8 Flash / Armadin provider incident

Operator-supplied evidence: 34 HTTP 400 responses followed successful MCP tool-call turns, 26 associated with final INFRA_ERROR tasks and 8 in records that later completed. Repetition 3 had 49 scheduled questions without a result. A repeated position-9 request followed an analyze_group_permissions response of 3,710,830 characters; a reconstructed messages-plus-tool-schemas core was estimated at 4.49 MB (not a complete HTTP payload). Because smaller requests also failed and larger ones succeeded, size is only a possible contributor. The response body was not saved; the exact rejection reason is unknown. Operator reports the harness used a broad PROVIDER_PROTOCOL label. Treat these as provider/protocol outcomes, not reasoning errors. Steven External cleanup errors are separate teardown issues.

The Qwen Flash/Armadin card has a specific note. Other infrastructure cases are labeled from their own public INFRA_ERROR/timeout outcome counts; no exact trigger is assigned without evidence.

API usage / cost

Input/output usage is present for 114/114 rows. Recorded cost is present for 0/114; cache-token fields are absent. The reports and cards mark costs unavailable/not computed rather than zero.

Output files

- analysis.md / analysis.html / analysis.pdf — human-facing scored/unscored ledger and reason-specific labels.
- analysis.json — raw public analyzer status values retained for audit.
- question-scoring-ledger.json — exact per-row right/wrong/scored/unscored counts and public cause tallies.
- model-cards/*.md, *.svg, and *.png — per-model/MCP cards with question scoring and bottom notes.
- recent-runs-executive-summary.* — concise overview and all row outcomes.
- This public subtree contains the reviewed loose files; no duplicate ZIP is included.

Public source links

- [Raw aggregate analysis](#) — historical ORI lifecycle status is retained.
- [Question scoring ledger](#) — final public outcome counts, distinct from retry/error tallies.
- [Presentation status ledger](#) — coverage/cause labels.
- [Model cards](#) — full per-repetition Markdown tables and compact SVG/PNG previews.

The SVG/PNG cards are compact previews of up to four rows; some cause lists are shortened. Use the Markdown cards or JSON ledgers for complete rows, causes, run identities, and repetitions.

Original public run reports (retained unchanged):
